EXPLANATORY NOTES

Introduction

This publication contains statistics relating to individual income recipients in 1978-79. The estimates were derived from a survey of annual income which was conducted throughout Australia in the period September to December 1979. Some statistics of the income of individuals, unemployed persons, income units and families have already been published (see paragraph 32), and further statistics will be published progressively.

2. The survey was based on a multi-stage area sample of private dwellings (about 15,000 houses, flats, etc.) and non-private dwellings (hotels, motels, etc.) and covered about one-third of one per cent of the population of Australia.

Scope

3. The estimates relate to all persons aged fifteen years and over except: members of the Australian defence forces living in military establishments; certain diplomatic personnel of overseas governments customarily excluded from census and estimated populations; overseas visitors holidaying in Australia; members of non-Australian defence forces (and their dependants) stationed in Australia; students in boarding schools, patients in hospitals and sanatoria and inmates of gaols, reformatories, etc.

Definitions

4. *Total income.* Questions were asked in respect of each person aged fifteen years or over, except those attending school full time, on the amount of income received in 1978-79 from each of the following sources: wages or salary; own business, farm, profession, etc. (net income); share in a partnership (net income); government social security and welfare cash benefits; superannuation; interest, dividends, rent, etc.; other sources, e.g. trust or will, maintenance or alimony.

5. *Income from wages or salary* was defined as income from all wage or salary jobs before the deduction of tax. Workers' compensation payments (other than lump sum payments) for temporary loss of wages or salary were included. Items such as payments in kind, employer contributions to board or rent, gratuities and tips, etc. may be subject to misreporting or omission.

6. *Income from own business, farm, profession, etc. and income from a share in a partnership.* In both of these cases, income was defined to be net of business expenses. If no income had been received in 1978-79 or a loss had been made, income from these sources was recorded as nil.

7. *Income from government social security and welfare cash benefits* includes income received through programmes of assistance to aged persons, incapacitated and handicapped persons, unemployed and sick persons, veterans and their dependants, widowed and deserted spouses, families and children; cash benefits for education; and other social security and welfare programmes.

8. *Income from superannuation* comprises regular payments made to a retired person or his survivors by a former employer, either directly or through a superannuation fund, insurance company, etc. Any lump sum payment received by a person on his retirement was excluded.

9. *Interest, dividends, rent, etc.* includes interest on savings, bonds, debentures, etc., dividends from stocks and shares, net income from rental of a house or other property and net royalties.

10. *Income from other sources* comprises income from items such as private educational scholarships; maintenance or alimony; a trust or will; and an annuity. Income paid at regular intervals and received by a beneficiary under a will, settlement, deed, gift or instrument of trust was included. However, a lump sum payment from any of these sources was not regarded as income.

11. *Earned income* is income from wages or salary or income from own business, farm, profession, etc. or income from a share in a partnership or the sum of any of these components.

12. *Private income* is total income (as defined in paragraph 4) less income from government social security and welfare cash benefits.

13. *Median income* is the amount which divides the distribution into two equal groups, one having incomes above the median and the other having incomes below it. Medians were calculated from grouped data with linear interpolation being used within the class interval in which the median fell.

14. *Mean income* is the amount obtained by dividing the total income of a group (e.g. income recipients, a given age group) by the number in that group.

15. *Full-time and part-time workers.* Persons were classified as either full-time or part-time workers on the basis of the kind of work in which they were mostly engaged during 1978-79, full-time work being defined as work occupying 35 hours or more per week.

16. *Full-year, full-time workers* are those who, for at least 50 weeks during 1978-79, worked or were on paid leave and were engaged mostly in full-time work. A person who worked for 26 weeks full-time and for 24 weeks part-time was classified as a full-year, full-time worker. However, it should be noted that most persons who work for a full year engage in either full-time or part-time work, but not in both.

17. *Full-year, part-time workers* are those who had worked in Australia for at least 50 weeks during the year 1978-79 and had been engaged mostly in part-time work.

18. *Part-year, full-time workers* are those who had worked in Australia for less than 50 weeks during the year 1978-79 and had been engaged mostly in full-time work. A person who had worked for 25 weeks full-time and for 24 weeks part-time would have been classified as a full-time worker; however, it should be noted that most persons who work for less than a year engage in either full-time or part-time work, but not in both.

19. *Part-year, part-time workers* are those who had worked in Australia for less than 50 weeks during the year 1978-79 and had been engaged mostly in part-time work.

20. *Persons with post-school qualification(s)* are those who stated they had gained a qualification (usually at a post-school education institution) after first leaving school. Included here are persons who, after first leaving school, completed school level qualifications at night classes or at technical and further education colleges.

21. *Classification of post-school qualifications.* Respondents indicated which of the following groups best described their highest qualification gained since leaving school:

- (a) *Degree*—bachelor degree, honours degree, masters qualifying, post-graduate diploma (e.g. Diploma of Education), masters degree, doctorate and post-doctorate degrees.
- (b) *Certificate (non-trade)/diploma*—certificate or diploma courses/qualifications in secretarial or business studies, nursing, teaching, town planning, etc.
- (c) *Trade certificate*—trade apprenticeship or training course, or training leading to recognition of competence in a skilled manual occupation, for example, plumbing, air conditioning, hair-dressing, motor mechanics, etc.
- (d) *Other*—secondary school course undertaken at night school or at technical and further education colleges, adult education course, hobby course or preparatory course plus those courses/qualifications which could not be classified to any of the above levels.

22. *Gini index of concentration.* This is one of the most widely used measures of inequality of income distribution. In the diagram on page 4, Lorenz curves have been drawn, showing cumulative percentages of males and females plotted against cumulative percentages of aggregate individual income.

23. The *egalitarian line* shows the hypothetical situation in which all individuals receive the same income. The Gini index of concentration is the ratio of the area between the egalitarian line and the Lorenz curve to the area of the triangle below the egalitarian line. The index, always between 0 and 1, is low for populations with relatively equal income distributions and high for populations with relatively unequal distributions.

24. The areas determining the six State capital cities in Tables 2-9 are the Statistical Divisions for those capital cities as defined in *Census of Population and Housing, 1976, Population and Dwellings in Local Government Areas and Urban Centres (Preliminary)* (2401.0-2408.0).

25. For a detailed description of occupations shown in Tables 18 and 19 reference should be made to *Classification and Classified List of Occupations, June 1976* (1206.0).

26. For a detailed description of industries shown in Table 20 reference should be made to *Australian Standard Industrial Classification (ASIC), 1978 Edition, Volume 1—The Classification* (1201.0).

Interpretation of results

27. Since the estimates are based on a sample, they are subject to sampling variability. (See Technical note.) In addition, they are subject to errors of response and reporting. Although some respondents referred to their records, in many cases the answers to the questions on income were based on memory. Some understatement in the estimates may be expected because of imperfect recall or misunderstanding, particularly of minor or irregular sources of income.

28. The survey did not obtain information on the standard of living of individuals or the way in which they had arranged their financial affairs. For a number of reasons the income reported as being received by an individual does not necessarily reflect his or her living standard. Gifts and donations, for example those made by relatives or charities, were not counted as income even though in many cases they may have been an important means of support. Many individuals would have received benefits not involving direct cash payments (e.g. pensioner benefits of various kinds). Others may have chosen to live off their savings.

29. Other points which should be kept in mind in interpreting the results of this survey are as follows:

- (a) For the purposes of the survey, total income included all income received while living in Australia (including income received from an overseas source) and all income received from an Australian source while living overseas.
- (b) Persons who had lived outside Australia for more than twelve weeks during 1978-79, and had worked overseas in a job or jobs unrelated to an Australian job or business, were excluded from all tables. All migrants who arrived in Australia after September 1978 were excluded.
- (c) Personal characteristics such as age and marital status may have changed between the reference year and the time of the interview.
- (d) Tables for *all income recipients* and *persons with earned income* include part-time workers and persons who worked for only part of the year.
- (e) In tables for *full-year, full-time workers*, persons with no income have been included in the calculation of means and medians.

Comparability of estimates with those for previous surveys

30. Similar surveys were conducted in respect of the years 1968-69 and 1973-74. However, care must be taken in making comparisons of survey results, for the following reasons:

- (a) In the 1968-69 and 1973-74 surveys, respondents were classified to occupations according to the 1966 and 1971 classifications of occupations respectively. 28 occupations (mainly in the field of medical care) were added to the 1971 classification to form the 1976 classification which has been used for the 1978-79 survey.
- (b) In the 1973-74 survey, respondents were classified to industry according to the 1969 Australian Standard Industrial Classification (ASIC). In the 1978-79 survey, the 1978 version of ASIC was used. Industry estimates for the two surveys may not be strictly comparable, particularly in mining, manufacturing, finance, property and business services.
- (c) The post-school qualification levels *non-degree tertiary* and *technician* as used in the 1968-69 and 1973-74 surveys have been combined to form the level *certificate (non-trade)/diploma* in the 1978-79 survey.

Reliability of the estimates

31. Since the estimates in this publication are based on information obtained from occupants of a sample of dwellings, they may differ from the figures that would have been produced if the information had been obtained from occupants of all dwellings. An indication of the

likely differences is given in the Technical note. See also paragraph 10 of the Technical note regarding non-sampling errors.

Occupation(b)	Mean earned income (\$)	Occupation(b)	Mean earned income (\$)
MALES			
Professional, technical and related workers	16,700	Tradesmen, production-process workers and labourers, n.e.c.	
Architects	19,100	(including miners and quarrymen)	10,860
Civil engineers	19,440	Ore and mineral treatment operators	13,190
Electrical and communication engineers	18,210	Upholsterers and related workers	9,250
Mechanical engineers	16,490	Machine tool makers, die makers, metal	11,600
Medical practitioners	33,240	Machine tool setters and operators, metal, including metal	
Nurses, certificated, general	11,460	machinists (so described)	11,160
Teachers	16,480	Aircraft mechanics	14,970
Clergymen, priests	7,860	Sheetmetal workers	9,940
Authors, journalists and related workers	15,160	Panel beaters	8,690
Draftsmen and tracers	12,430	Electricians, including electrical mechanics	12,400
Accountants, auditors	18,400	Electrical fitters	12,340
Personnel specialists	16,860	Electronic fitters	12,700
Computer programmers	14,830	Radio, TV, mechanics and repairmen	10,990
		Telecommunication technicians	12,230
Administrative, executive and managerial workers	15,830	Linesmen, electrical, cable joiners	10,740
Clerical workers	12,230	Assemblers, process workers, metal, electrical (so described)	10,100
Book keepers and cashiers, including bank tellers	12,380	Factory workers, metal, electrical (so described)	12,280
		Tradesmen's assistants, metal, electrical	10,330
Sales workers	11,780	Carpenters, joiners	10,400
Insurance salesmen	16,750	Cabinet makers	8,580
Auctioners, valuers and real estate salesmen	12,180	Sawmill and timber yard workers	10,850
Commercial travellers and manufacturers agents	12,570	Painters and decorators, building construction and	
		maintenance including painters (so described)	9,780
Farmers, fishermen, hunters, timber getters and related workers	8,420	Bricklayers	8,610
Fruit growers, excluding grape	7,940	Plasterers	10,120
Graziers	9,390	Concrete and terrazzo workers	9,860
Dairy farmers	6,540	Pipelayers, construction	9,700
Wheat and sheep farmers (so described)	9,200	Compositors and typesetters	13,210
Farmers, mixed, and farmers (so described)	8,490	Printing machinists, printers (so described)	11,740
Fruit growing workers, including grape	6,360	Bakers, pastrycooks	10,160
Station hands, drovers, shearing shed hands and general		Butchers and meat cutters	10,410
hands grazing	8,170	Chemical production-process workers	12,630
Gardeners, nursery workers	8,200	Rubber product workers	11,560
Groundkeepers, greenkeepers and ground caretakers	8,800	Plastic product workers	10,080
Farm workers, mixed farming, farmers (so described), type of		Packers, wrappers, labellers	9,470
farming not stated	6,620	Stationary engine drivers	16,160
Workers in transport and communication	11,420	Operators of earth moving and other construction machinery	11,680
Drivers, railway	14,340	Material handling equipment operators	11,110
Motor bus drivers	11,780	Storemen, including storemen and packers (so described)	9,340
Motor truck and van drivers, including deliverymen (so			
described) and motor drivers (so described)	10,530	Service, sport and recreation workers	12,010
Traffic controllers and despatchers	16,550	Fire brigade and fire prevention workers	13,870
Postmen, postal assistants and postal officers	10,820	Policemen	14,250
		Other protective service workers	13,210
		Cleaners, offices, buildings	10,480
		Barbers, hairdressers and beauticians	10,620

TECHNICAL NOTE

Estimation procedure

Estimates derived from the survey are obtained by using a complex ratio estimation procedure, which ensures that the survey estimates conform to an independently estimated distribution of the population by age and sex, rather than to the age and sex distribution within the sample itself.

Reliability of the estimates

2. Since the estimates in this publication are based on information obtained from occupants of a sample of dwellings they are subject to sampling variability; that is, they may differ from the figures that would have been produced if all dwellings had been included in the survey. One measure of the likely difference is given by the *standard error*, which indicates the extent to which an estimate might have varied by chance because only a sample of dwellings was included. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all dwellings had been included, and about nineteen chances in twenty that the difference will be less than two standard errors. The standard error can also be expressed as a percentage of the estimate, and this is known as the *relative standard error*.

3. Space does not allow for the separate indication of the standard error of all estimates in this publication. Table A shows standard errors of estimates of numbers of persons for a range of estimate sizes, while Table B shows relative standard errors of estimates of mean and median earnings for different numbers of persons. These figures will not give a precise measure of the standard error of a particular estimate, but they will provide an indication of its magnitude.

4. An example of the use of Table A is as follows: Table 1 shows that the estimated number of income recipients in Australia whose total income for 1978-79 was between \$15,000 and \$16,000 was 203,500. From Table A it will be seen that the estimate has a standard error of about 7,300 and therefore there are about two chances in three that the value that would have been produced had all dwellings been included in the survey will fall within the range 196,200 to 210,800 and about nineteen chances in twenty that the value will fall within the range 188,900 to 218,100.

5. The procedure for obtaining the standard error of an estimated mean or median is as follows: from the table containing the mean or median obtain the number of persons to which it refers, from Table B obtain the percentage standard error appropriate to that number, interpolating where necessary, and apply this percentage to the estimated mean or median. If the estimate relates to part-time employees the standard error should be multiplied by 2 for males and 1.4 for females and persons.

6. An example of the use of Table B is as follows: Table 6 shows the mean total income of male income recipients in Brisbane as \$9,860 and the number of such males as 337,200. Table B shows the relative standard

errors of estimates for Queensland based on 300,000 and 500,000 persons to be 2.7 per cent and 2.1 per cent respectively. By interpolation the relative standard error of the estimate is about 2.5 per cent, or about \$250 (2.5 per cent of \$9,860, rounded to the nearest 10 dollars). Therefore there are about two chances in three that the value that would have been produced had all dwellings in Brisbane been included in the survey will fall within the range \$9,610 to \$10,110 and about nineteen chances in twenty that the value will fall within the range \$9,360 to \$10,360.

7. As the standard errors in the tables show, the smaller the estimated number of persons the higher is the relative standard error. Very small estimates are thus subject to such high standard errors (relative to the size of the estimate) as to detract seriously from their value for most reasonable uses. In this publication estimates below the levels shown in Table A, and means, medians and other derived values based on such estimates, have not been included. Although figures for numbers of persons can in some cases be derived by subtraction they should not be regarded as reliable.

8. Published figures may also be used to estimate the difference between two survey estimates (estimates of numbers, means, medians and percentages). Such figures are themselves estimates and therefore subject to sampling error. The sampling error of the difference between two survey estimates depends on the standard errors of the original estimates and on the relationship (correlation) between the estimates. An approximate standard error of the difference between two estimates (x-y) may be calculated by the following formula:

$$\text{Standard error (x-y)} = \sqrt{\{\text{Standard error (x)}\}^2 + \{\text{Standard error (y)}\}^2}$$

While this formula will be exact only for differences between separate and uncorrelated (unrelated) characteristics or sub-populations, it is expected to provide a good approximation for all differences likely to be of interest in this publication.

9. An example of the use of the above formula is as follows:

Table 4 shows that for male income recipients in New South Wales the difference between the estimates of the mean total income of those in Sydney and the rest of the State was \$1,130 (\$10,690-\$9,560). By using the procedure outlined in paragraph 5 the standard errors of the two original estimates can be approximated as \$190 and \$210 respectively. Therefore the standard error of the difference of \$1,130 is $\sqrt{(\$190)^2 + (\$210)^2}$, or \$280 (rounded to the nearest 10 dollars). Therefore there are about two chances in three that the difference that would have been obtained had all dwellings in New South Wales been included in the survey will fall within the range \$850 and \$1,410 and about nineteen chances in twenty that the value would fall within the range \$570 and \$1,690.

10. The imprecision due to sampling variability, which is measured by the standard error, should not be confused with inaccuracies that may occur because of imperfections in reporting by interviewers and respondents. Inaccuracies of this kind are referred to as the *non-sampling error*, and they may occur in any enumera-

tion, whether it be a full count or only a sample. Every effort is made to reduce the non-sampling error to a minimum by careful design of questionnaires, intensive training and supervision of interviewers and efficient operating procedures.

TABLE A—STANDARD ERRORS OF ESTIMATES

Size of estimate (Persons)	N.S.W.	Vic.	Qld	S.A.	W.A.	Tas.	N.T.	Australia		
								A.C.T.	Relative standard error (per cent)	
—number—
